

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

PREFACE TO THE SIXTH REVISED EDITION.

"The changes in Medical Science," says the British Medical Journal, "are so rapid that it is impossible for the most determined reader of the scientific periodicals supplied by the journals to keep pace with them. Each step in advance entails a corresponding enlargement of medical terminology. This necessary evil is aggravated by the new words which many find needful to express their peculiar ideas. From these causes comes the ever-increasing output of medical dictionaries in recent years. The number of new editions of these that is called for at short intervals shows the keenness of the demand." That, despite this lively rivalry, nearly 300,000 copies of my medical dictionaries have been bought by the profession is a proof that the present edition, entirely rewritten, of *The Pocket Pronouncing Medical Dictionary* is justified.

Since the last edition was made there has appeared the *English-Chinese Lexicon of Medical Terms, Compiled for the Terminology Committee* by Philip B. Cousland, M. B., C. M. (Edin.), and published in Shanghai by the Publication Committee of the Medical Missionaries of China. In his introduction Dr. Cousland says that this most noteworthy Lexicon "is largely based on Gould's Medical Dictionary and the Nomenclature of the Royal College of Physicians, England."

This edition has 142 pages more than the former, but by the use of various typographical devices the size remains about as before. An actual coun

PREFACE

of the words shows the number to be 34,613, an increase of about 4,500 over the fifth edition. Although, however, a large number of useless and obsolete terms were struck out during the revision this does not show the actual number of new words added. It serves, however, to point out the large amount of work accomplished. Many important definitions have been rewritten and the eponymic terms and tests which were formerly in separate tables have now been placed throughout the book in their alphabetical order. An index of tables and encyclopedic definitions appears on page xx.

I am most grateful to Doctor Albert C. Duran for the scholarship he has generously devoted to the preparation and proof-reading of this revision. My thanks are also due Doctor George Bachman for a large amount of preliminary work done on the manuscript.

FROM THE
PREFACE TO THE FIRST EDITION.

Medical students and physicians often have need of a small, elementary word-book that may be slipped into the pocket for hurried reference, and to serve as a passing reminder of the essential meanings of the more commonly used terms. Such books are too frequently made for the benefit of the publisher rather than for that of the consultant, and therefore err in a condensation so great as to result in vagueness and inaccuracy, and err especially in the definition of too few words—and those of decidedly antique flavor. The little volume herewith offered seeks to avoid these faults, and particularly that last mentioned, by containing about double the number of words included in the ordinary pocket lexicons, and by being made up of the words of the living medical literature of the day. The addition of the useful tables of muscles, nerves, arteries, the various microorganisms, comparison of thermometric scales, and, above all, of a dose-table compiled directly from the latest and best works on *materia medica*, must also prove useful.

Jolles's Test for Bile Pig'ments in U'rine. Put in a stopper cylinder 50 c.c. of urine, and add a few drops of 10 per cent. hydrochloric acid and an excess of a barium chlorid solution with 5 c.c. of chloroform, and shake for several minutes. Then by means of a pipet remove the chloroform and the precipitate, place in a test-tube, and heat on the water-bath to about 80° C. When the chloroform has evaporated, carefully decant the liquid from the precipitate and let three drops of concentrated sulphuric acid, containing one-third fuming nitric acid, flow down the sides of the test-tube. If bile pigments be present, the characteristic coloration results.

PHAGOCYTE

Pflueger's Law of Contraction. Galvanic stimulation of a nerve causes muscular contraction, which varies uniformly according as the kathode or the anode is applied, or as the current is closed or opened. Certain deviations from this law constitute the reaction of degeneration. The law may be briefly stated as follows:

CURRENT STRENGTH	KC	KO	AC	AO
Weak.....	C
Medium.....	C	..	C	C
Strong.....	Te	C	C	C

C, contraction; Te, tetanic contraction.

P.'s Law of Reflex Action. (1) If stimulation of a sensory nerve be followed by a unilateral reflex movement, the latter always occurs on the side to which the sensory nerve belongs. (2) If the stimulus received by a sensory nerve extend to motor nerves of the opposite side, contraction occurs only in the corresponding muscles. (3) If the contraction be unequal on the two sides, the stronger contraction always takes place on the side which is stimulated. (4) If the reflex excitement extend to other motor nerves, the direction of the impulse from the sensory to the motor nerve is from before backward in the brain and from below upward in the spinal cord—i. e., always in the direction of the oblongata. **P.'s Tubes**, ovarian tubes, saciform or tubular ingrowths of the germ epithelium on the antero-internal surface of the Wolffian body; they ultimately form the cortex of the ovary.

calcium chlorid solution, and carefully reevaporate to dryness. In the presence of inosit a rose-red residue is obtained. **S.'s Test for Leu'cin**, carefully evaporate the leucin to dryness on platinum with nitric acid. Add a few drops of sodium hydrate and warm, and the colorless residue changes to a color varying from pale yellow to brown, according to the purity of the leucin; and further evaporation agglomerates it into an oily drop, which rolls about on the foil. **S.'s Test for Ty'rosin**, carefully evaporate the substance to dryness on a platinum foil with nitric acid. TRUNCUS

Trommer's Test for Glucose. To the liquid rendered alkaline by caustic soda a fairly strong solution of cupric sulphate is added drop by drop until a little of the copper hydrate formed remains undissolved on shaking. On warming in the presence of glucose, a yellow reduction of hydrated suboxid of copper is first formed, and then red suboxid separates, even below the boiling-point. If not enough copper salt has been used, the reaction will be yellowish-brown in color; but if the copper salt is in excess, the excess of hydrate is changed by boiling into a dark brown hydrate, which interferes with the test.

Authority to use for comment the Pharmacopœia of the United States of America, Eighth Decennial Revision, in this volume, has been granted by the Board of Trustees of the United States Pharmacopœial Convention, which Board of Trustees is in no way responsible for the accuracy of any translations of the official weights and measures or for any statements as to strength of official preparations.

The Doses given are for adults; for children, either Young's or Cowling's rule is sufficiently accurate for most drugs, except narcotics and cathartics. According to Young's rule the dose is obtained by dividing the age by 12 plus the age. Thus, for a

child of 3 years, $\frac{3}{3+12} = \frac{1}{5}$ or $\frac{1}{5}$. Cowling's rule is to divide the number of the next birthday by 24. Thus, for a child 5 years old, $\frac{5}{24} = \frac{1}{5}$. Of narcotics, like opium, not more than one-half of this proportion should be prescribed, while of cathartics this dose may be exceeded two or three times.

For subcutaneous administration the dose should be about one-half of that given by the mouth; and for rectal administration about twice the amount given by the mouth. Equivalents: one teaspoonful, ʒi or 4 Cc.; one dessertspoonful, ʒij or 8 Cc.; one tablespoonful, ʒiv or 15 Cc.

VETERINARY DOSE-TABLE

GIVING THE DOSES OF OFFICIAL AND UNOFFICIAL DRUGS
IN BOTH THE ENGLISH AND METRIC SYSTEMS, IN
ACCORDANCE WITH THE NEW U. S. PHARMACOPOEIA.

COMPILED SPECIALLY FOR GOULD'S POCKET DICTIONARY,
FIFTH EDITION,

By W. S. DEVOE, D.V.S.,

UNIVERSITY OF NEW YORK (VETERINARY DEPARTMENT);
FORMERLY INSPECTOR, BUREAU OF ANIMAL INDUSTRY,
U. S. DEPARTMENT OF AGRICULTURE.

Authority to use for comment the Pharmacopœia of the United States of America, Eighth Decennial Revision, in this volume, has been granted by the Board of Trustees of the United States Pharmacopœial Convention, which Board of Trustees is in no way responsible for the accuracy of any translations of the official weights and measures or for any statements as to strength of official preparations.

Taking the horse as the standard, the cow would take one and a half times; the sheep, one-fifth; the swine, one-eighth; the dog, one-sixteenth; the cat, one-thirty-second, or one-half the dose for the dog.

The dose for the dog is about the same as the human dose, but the size of the dog is taken into consideration. Taking the dog or man as the standard, the increase in the dose for the pig would be twice the amount; sheep, three times; horse, sixteen times; cow, twenty-four times.

For hypodermic use, the dose should be half that used by the mouth. Intravenous doses, one-half or two-thirds of the hypodermic dose. For use by the rectum, should be twice that by the mouth.

Equivalents. One teaspoonful of liquid equals about F 3 i (4 Ca.); of powder 2 iiss (3.2 Gm.); one dessertspoonful F 3 ii (8 Ce.); one tablespoonful of liquid about 3 ss (15 Ce.); of powder about 3 ii (8 Gm.); one wineglassful about F 3 iiss to ii (45 to 60 Ce.); one teacupful about F 3 iv (120 Ce.); one tumblerful about F 3 iv to viii (120 to 240 Ce.).

In the following table the amount prescribed is upon a conservative basis, giving the Veterinarian an opportunity to use his discretion in increasing or diminishing the amount, after considering the species of animal, size, disease and idiosyncrasy of the patient.

Indebtedness is acknowledged to the following books: BELL'S PRESCRIPTION WRITING; FISH'S DOSE BOOK; POTTER'S MATERIA MEDICA, PHARMACY AND THERAPEUTICS; WILCOX'S MATERIA MEDICA AND PHARMACOLOGY; WINN'S VETERINARY MATERIA MEDICA; STEWART'S COMPEND OF PHARMACY; POTTER'S COMPEND OF MATERIA MEDICA; TYRODE'S PHARMACOLOGY; MUIB'S MANUAL OF MATERIA MEDICA AND PHARMACY; QUITMAN'S SYNOPSIS OF VETERINARY MATERIA MEDICA AND THERAPEUTICS.

Abbreviations.—H. Horse; C. Cattle; S. Sheep and Swine; D. Dog.

The time that has elapsed since the appearance of the last edition of this popular manual has necessitated very many changes and additions, therefore the general arrangement has been considerably modified. Several new sections have been added such as Pellagra, Glandular Fever, Foul Breath, Cammidge's Reaction, Paralysis of the Laryngeal Muscles.

This edition contains 100 pages of reading matter more than the previous one, besides a much fuller index. Some of the old prescriptions have been discarded and many new ones introduced.

The section on Treatment will be found much more complete and the prescriptions more numerous.

"This is the book *Par Excellence* for the busy general practitioner."—*N. Y. Medical Times*.

"It covers nearly the whole field of practice and each subject, while condensed, is so well expressed and replete with the points that need to be known to make a clear picture of an affection, that it will be found very useful for quick reference in the physician's office."—*American Medical Monthly*.

"The favorable recognition of the many good qualities of this work accorded in these columns on its original appearance has received practical confirmation in the call, in little more than a year, for a second edition. Certain sections of the work have been revised and new subject matter has been added. The chapter on bronchoscopy and laryngoscopy has been made more complete, and the medical and surgical treatment of the lower air passages considered in detail. Attention may be drawn again to the completeness of the presentation, the stamp of practical capability animating the style and scope of the work, and the succinctness of the diction."—*N. Y. "This is a valuable addition to the text-books of medical diagnosis, although the author designates it as a manual. Students and practitioners alike will find it very convenient. A great accessory to its usefulness is to be found in the many illustrations, for even if the description of a disease is as explicit and concise as possible, it remains only theory, while a clear picture comes nearest to reality in practice. The book is well arranged, from the general diagnosis to the special, and without going too much into detail it avoids aphorisms. Added to it are chapters on some of the commoner feigned states, and a brief summary of the symptoms and treatment of acute poisoning."

THE object in view in the preparation of this volume was the selection and presentation of the more important facts of physiology, in a form which it is believed will be helpful to students and to practitioners of medicine. Inasmuch as the majority of students in a medical college are preparing for the practical duties of professional life, such facts have been selected as will not only elucidate the normal functions of the tissues and organs of the body, but which will be of assistance in understanding their abnormal manifestations as they present themselves in hospital and private work. Both in the selection of facts and in the method of presentation the author has been guided by an experience gained during twenty active teaching.

Fifth Edition, Revised and Enlarged. With 5 plates and 245

"Since the first edition of this work saw the light it has made
for itself an assured place in the literature of medicine comparable
to that held by Niemeyer or Bristow a quarter of a century ago,
and for the book itself little more remains to be said.

"In the present edition the author tells us the section dealing
with the infectious diseases has been subjected to special scrutiny
and revision, the additions and alterations here being as
numerous as to necessitate a resetting of this entire portion of the
work.

"The sections dealing with pathology, symptomatology, and
diagnosis are throughout classical in their completeness and
accuracy of description."—*Medical Record*, New York.
